	Power Issue	Water damage	Misuse Damage	Bad component	Fall damage
Mother board	Motherboard has visible burn marks around some of the components, looks like it will need replacing. Garrick Hilton	Water got into the machine through the top cooling vents..that's probably what did it Garrick Hilton	Motherboard wasn't connected to the tower correctly, causing it to come loose. Garrick Hilton	Faulty motherboard caused components to be unresponsive Garrick Hilton	Motherboard was damaged due to a fall and impacting the ground Garrick Hilton
	There's power to the machine after the spike still, but nothing is getting through the motherboard. Garrick Hilton	fluid spilled against the motherboard and damaged some components Garrick Hilton	Motherboard was not connected correctly, causing damage to other components Garrick Hilton	the motherboard is too old to take any newer upgrades and needs to be upgraded itself Garrick Hilton	Due to the case being knocked some components have come loose from the motherboard Garrick Hilton
	There is not enough power to initialize the motherboard, nevermind anything else. Garrick Hilton		Due to being overclocked the motherboard has taken significant damage Garrick Hilton	Having seen it's end of days the motherboard is no longer with us. Garrick Hilton	
			Animal fur got into the motherboard, causing issues with connections and overheating Garrick Hilton		

	Power Issue	Water damage	Misuse Damage	Bad component	Fall damage
CPU	Nothing is getting to the CPU, the power spike probably fried the connectors Garrick Hilton	Liquid collected around the cooling rack and damaged the CPU Garrick Hilton	CPU was not installed correctly, causing multiple problems Garrick Hilton	Fault with the CPU caused problems when operating the machine Garrick Hilton	CPU became faulty after the impact after the machine was dropped Garrick Hilton
	Nothing is getting through to the CPU, is most likely a power issue Garrick Hilton	Water damage caused a short circuit in the connectors of the CPU Garrick Hilton	The CPU housing was loose, causing damage to the component Garrick Hilton	This CPU was at least 5 years out of date 5 years ago and has failed Garrick Hilton	The CPU housing has been knocked loose and has caused damage to the cPU Garrick Hilton
			The CPU has overheated due to the overclocking and is no longer responds Garrick Hilton	Due to the age of the CPU performance has been severely impacted Garrick Hilton	
			Fur got stuck in the CPU housing, causing heat damage to the components Garrick Hilton		

	Power Issue	Water damage	Misuse Damage	Bad component	Fall damage
RAM	There is visible burn marks around the RAM connectors and the BIOS fails to initialise Garrick Hilton	Water has seeped into the base of the RAM, causing the connections to short circuit Garrick Hilton	RAM was not seated correctly into it's housing, causing it to be unreadable Garrick Hilton	Faulty RAM impacted the performance of the machine. Garrick Hilton	the RAM received falling damage, becoming unfunctional Garrick Hilton
	Inadequate power supply has left the RAM wanting. Garrick Hilton	Water has short circuited the ram sticks, it's gonna take a lot of rice and a million kisses to fix this. Garrick Hilton	Unseated RAM caused the computer to be unable to even boot up, giving three beeps. Garrick Hilton	I don't know how old this RAM is, but I think I saw some on the antiques roadshow Garrick Hilton	The RAM has been knocked loose from it's housing. Garrick Hilton
			RAM has taken too much voltage and is now unresponsive on boot Garrick Hilton	The RAM is too old to function with the current software on the PC Garrick Hilton	
			I'm not sure how this happened, but fur is interfering with the RAM connections Garrick Hilton		

	Power Issue	Water damage	Misuse Damage	Bad component	Fall damage
GPU	Nothing is coming through on the GPU, the LED's don't even come on, looks like no power is getting to it anymore. Garrick Hilton	Water got into the seating for of the GPU and short circuited the component Garrick Hilton	The GPU was installed incorrectly, causing it to misalign with the connectors. Garrick Hilton	Faulty GPU caused issues with the display on the monitors Garrick Hilton	GPU was damaged when the machine was dropped, causing it to become unresponsive Garrick Hilton
	The GPU is not getting anypower, thus, does not function. Garrick Hilton	Liquid got into the PSU and the component itself and fried the circuitry. Garrick Hilton	The GPU has been damaged from the overclock, running worse than factory settings Garrick Hilton	You could probably still run DOOM on this GPU, but you might struggle with Age of Empires Garrick Hilton	the GPU has been rattled by the knock and is now showing errors Garrick Hilton
			Fur got into the GPU, ausing the fans to be blocked and causing overheating problems Garrick Hilton	The GPU is no longer supported by any new software and needs to be retired. Garrick Hilton	Due to the knock the computer is freezing and the GPU is causing stutters Garrick Hilton

	Power Issue	Water damage	Misuse Damage	Bad component	Fall damage
PSU	Turned the computer on like normal and there was a pop and it smelled like burning. Garrick Hilton	Water got into the PSU and it didn't mix very well with electricity. Garrick Hilton	Improper connections in the PSU caused issues with the power supply to the machine. Garrick Hilton	A faulty PSU caused components to not receive the right amount of power Garrick Hilton	The power supply was damaged during the fall, Garrick Hilton
	Computer was running like normal when everything shut off randomly, when I turn it back on I get a blank screen. Garrick Hilton	BZZZZT, That's what you're gonna be hearing everytime you turn this bad boy on. Garrick Hilton	Improper installation caused sparks and short circuited the system. Garrick Hilton	It should be a crime to be running a PSU this old. Garrick Hilton	The power supply has taken a knock and needs some repairs. Garrick Hilton
	It's not producing enough power to supply the PC and peripherals and needs to be replaced Garrick Hilton		Overclocking a PSU? what else did they think would happen... Garrick Hilton	Due to the age of the parts the PSU is unsafe to use. Garrick Hilton	
			The customers pet was messing with the PSU and caused it to short circuit. Garrick Hilton		

Virus	There has been damage to the system due to a viral malware infection in the systems files Garrick Hilton			Phishing Garrick Hilton	the user had clicked n a link which had compromised their systems integrity, we have fixed the issue now. Garrick Hilton
Ransom ware	They were locked out of their system and had their entire system encrypted, we had to install from backup. Garrick Hilton	They were locked out of their system and had their entire system encrypted, we had to do a complete reformatting. It was that or pay the hackers Garrick Hilton		Worm Garrick Hilton	A worm was discovered in the files during a virus scan, customer has been advised to check other computers on the network Garrick Hilton
Spyware	the user had inadvertently installed spyware, it has been collecting data from them for a while now.	the user had inadvertently installed spyware, it has been collecting data from them for a while now. We had to uninstall McAfee Garrick Hilton		Trojan Garrick Hilton	Due to installing a program from a dodgy website the user had run a trojan on their system and caused an infection Garrick Hilton
Adware	Users screen was completely full of adverts, it was safer to put the machine down with a reformat than try and run a scan Garrick Hilton	User complained about ransom pop-ups on their screen, we found adware through a virus scan Garrick Hilton		Keylogger Garrick Hilton	There was a keylogger found on the users PC, it had been logging everything that had been typed on the machine Garrick Hilton
Botnet Malware	User complained of their machine running slow, it was found to have a botnet installed on it running in the background. Garrick Hilton			Crypto miner Garrick Hilton	After installing new software the user saw their CPU usage spike weirdly, it was found to be secretly harbouring a cryptominer. Garrick Hilton
